Introducing the new standard curve for PAP.

Throw away your graph paper. The new ESKACHEM Prostatic Acid Phosphatase immunoaassisted assay (PAP-IAA) from SKI eliminates the standard curve. And you'll save more than plotting time and graph paper with ESKACHEM PAP. No need for gamma counters or radioactive waste disposal systems. PAP-IAA is a specific non-isotopic assay, results are read on a standard spectrophotometer.

And, because of the greater shelf life, reagent waste is minimized. It's more economical, too. Since multiple calibration points are not required, you can save as much as 50 percent in reagent costs on five PAP assays a day.

Contact your SKI representative to learn more about our latest advance in reagent technology. We won't throw you a curve.

PAP-IAA
The curveless assay.

The Thirteenth Annual Symposium on Advanced Analytical Concepts for the Clinical Laboratory is a continuation of the symposium series initiated in 1967 to serve as a forum for the presentation and discussion of advanced concepts and techniques in their early stages of development. The results have been quite successful, as evidenced by the fact that much of the instrumentation and methodology currently in routine use in clinical laboratories was first introduced in these symposia. This year's special topic, "Advanced Immunotechniques," is no exception, and the progressive developments in immunochemistry today, especially the analytical uses of monoclonal antibodies, are expected to become the routine technology of the future. As in the past, the Thirteenth Annual Symposium on Advanced Analytical Concepts for the Clinical Laboratory is sponsored by the American Association for Clinical Chemistry and the Oak Ridge National Laboratory with support provided by the Medical Products Division of Union Carbide Corporation. The symposium was organized and directed by Carl A. Burtis (Chairman), Charles D. Scott, Gerhard Ertingshausen, Michael A. Harpold, Robert S. Melville, and Thomas O. Tiffany.

Session Chairman:
I. Analytical Concepts—Helena Greenwood, Syva Co.
II. Analytical Systems—Brian Renoe, University of Virginia
III. Advanced Immunotechniques—Thomas Adams, Hybritech, Inc.

Proceedings of the past symposia have been published in appropriate clinical journals (1-12), and again this year we are pleased to have the proceedings of the symposium published in Clinical Chemistry.

The Fourteenth Symposium on Advanced Analytical Concepts for the Clinical Laboratory is planned for April 29 and 30, 1982, at Gatlinburg, TN, adjacent to the Great Smoky Mountains National Park. We encourage comments or discussions relevant to the format or content of that symposium.
