PENTEX® Offers More Of The Bulk Ingredients You Need To Manufacture Diagnostic Kits

When your applications call for high quality bulk ingredients, PENTEX® brand Blood Proteins are out front. Call on the experience and talent of Miles technical specialists when you need assistance with manufacturing problems or have a tough challenge. We'll fit the ideal protein to your need. We can adapt or modify to suit your system or custom manufacture a product to fit your particular specifications.

Miles Inc., Diagnostics Division is the world's largest producer of high quality bulk Blood Proteins. We offer a wide selection of competitively priced bovine and human albumins, transferrins, cholesterol and other bulk diagnostic ingredients.

For information listing the characteristics, typical values and applications of the complete line of PENTEX diagnostic products, call: 1-800-227-9412

Myocardial infarction?
The race against time is on!

Rapid Myoglobin Quantitation

Early identification of AMI
Elevated serum Myoglobin levels can be detected at least 3–4 hours earlier than CK-MB
The necessary "plus" to the 30% unclear ECG

Monitoring of AMI
Earliest identification of reinfarction with laboratory methods
Monitoring of fibrinolytic therapy

Simple and rapid quantitative Myoglobin determination with Behring Systems

Behring TurbiTimeSystem
The optimal solution for emergency purposes
Results within seconds

Behring Nephelometer System
The fully automated solution
Results within a few minutes
You're aware of the impressive possibilities of today's immunoassay technology. But you haven't found a single automated immunoassay system that delivers those possibilities to your laboratory.

Access®
Automated immunoassay technology that breaks through the limits and delivers the possibilities.

Until now.

Sanofi Diagnostics Pasteur has introduced the ACCESS® Immunoassay System, an automated, random access system of unparalleled performance and simplicity in a surprisingly small bench-top analyzer.

ACCESS gives you a combination of performance capabilities available on no other system. Features such as continuous and STAT access, onboard refrigeration of 24 reagents, extraordinary analytical performance across a broad menu of disease states, up to 100 tests per hour and chemiluminescent detection.

But along with powerful performance, ACCESS also offers you the benefits of simplicity. The reduced complexity of fewer moving parts and a single pipette for improved reliability and reduced maintenance. Arm's-length access to all system resources and devices for efficient workflow and convenient, intuitive operation. And it all comes with Sanofi Diagnostics Pasteur's commitment to superior customer service.

Before you decide to purchase any other automated immunoassay system, call Sanofi Diagnostics Pasteur. And ACCESS the possibilities.

How the Greatest Minds in Clinical Chemistry Stay That Way

Join today and get Clinical Chemistry journal for November and December 1992 FREE!* That's 14 issues for the price of 12!

Whether you're a medical technologist, chemist, pathologist, lab technician, director or researcher... if your profession touches the world of clinical chemistry, you need to be a member of the American Association of Clinical Chemistry! AACC gives you a forum to exchange ideas, and solutions... to share problems... to keep up-to-date on late-breaking new developments... to meet new colleagues... and build crucial professional relationships.

Only AACC membership offers you the opportunity to:

- Receive Clinical Chemistry journal -- FREE*;
- Attend the AACC National Meeting at a 25% discount;
- Meet and network with professional colleagues;
- Be a part of the most dynamic organization for professionals in the clinical chemistry field.

AACC. How the greatest minds in clinical chemistry stay that way.

*Full Members and Student Associates only.

MEMBERSHIP APPLICATION

CATEGORY OF MEMBERSHIP

☐ MEMBER $100. (Open to persons holding an earned baccalaureate or higher degree in science, medicine, or academic equivalent and engaged in professional activities commonly associated with clinical chemistry. Includes subscription to Clinical Chemistry.)

☐ AFFILIATE $50. (Open to persons with an interest in the clinical chemistry field who do not desire or qualify for other membership categories. Affiliates do not receive Clinical Chemistry journal.)

☐ STUDENT ASSOCIATE $25. I certify I am enrolled full-time at (school/city/state) and expect to graduate in (month and year) (school/city/state). I am seeking the degree.

Mail completed application and payment to: American Association for Clinical Chemistry, 2029 K Street, N.W., Washington, D.C. 20006 800-892-1400 202-857-0717 FAX 202-887-5093

Membership year is January 1 - December 31.

Note for International Members: Clinical Chemistry journal will be shipped by surface mail (overseas 6-10 weeks). To expedite journal delivery, Canadian and Mexican members may pay an optional postal fee of $20 U.S. or air mail delivery. For all other non-U.S. members, the optional fee is $40 U.S. for air mail (4-6 weeks) or $150 U.S. for air mail (7-10 days).

Fax this application with your Mastercard or Visa Number to (202) 887-5093

CLINICAL CHEMISTRY ABROAD ONLY
CIBA Corning Diagnostics 10A
Information for Authors

Clinical Chemistry, issued monthly, is published by the American Association for Clinical Chemistry, Inc., under the direction of a Board of Editors. Equal consideration is given to original manuscripts in English from any country, whether or not the author is a member of the Association.

The information provided here essentially concurs with the "Uniform Requirements for Manuscripts Submitted to Biomedical Journals" (1).

Scope of the Journal

Clinical Chemistry welcomes contributions that contain original information, experimental or theoretical, that advances the science of clinical chemistry. Such information may concern basic materials or principles, analytical and molecular diagnostic techniques, instrumentation, data processing, statistical analyses of data, clinical investigations in which chemistry has played a major role, and laboratory animal studies of chemically oriented problems of human disease.

Editorials and Reviews are ordinarily invited. Unsolicited manuscripts in these categories are also welcome. The prospective author should submit, for review by the Editor, a brief outline of the proposed editorial or review before preparing it in final form. All Reviews undergo the normal peer-review process of the journal.

Book Reviews also are ordinarily invited. Authors interested in writing these reviews should confer with the Book Reviews Editor.

Other appropriate contributions include Articles, Case Reports, Case Conferences, Scientific Notes, Opinions, History, Technical Briefs, and Letters to the Editor. Prospective authors should consult recent issues of the journal to determine the appropriate category for their manuscript and for examples of acceptable style.

Review of Manuscripts

Manuscripts are evaluated by two anonymous peer reviewers who may or may not be members of the Editorial Board. Reviewers are expected to disqualify themselves before reviewing papers in cases where there may be a conflict of interest. When reviewers clearly disagree on the merits of a manuscript, a referee may be asked to give an opinion with the conflicting comments in hand.

Authors are usually notified of the disposition of a manuscript within 3 to 4 weeks of the date of its receipt by the Editor.

The principal desiderata for an acceptable manuscript are:

• subject matter that is original and significantly advances the state of knowledge of clinical chemistry
• conclusions that are justified from the design of the experiments and the data presented
• information that is sufficiently detailed to permit replication of the work by a competent clinical chemist

• writing that is clear, concise, and grammatical.

Editorial Policies

Manuscripts are considered for publication with the understanding that (a) each author has participated significantly in the work and assumes responsibility for the manuscript's content; (b) if the paper is accepted, copyright is transferred to the publisher under the signatures of all authors; and (c) no paper presenting the same information—other than an abstract or preliminary report (cited in the manuscript)—has been or will be published elsewhere. In addition, the journal requires that author affiliations, sources of support, and potential conflicts of interest (actual or possibly perceived as such) be acknowledged. This agreement can be conveyed by copying and completing the Authors' Assurances and Assignment of Copyright form provided on page 6 of this Information. Even if an authorized agent for an employer or institution transfers the copyright to AACC, all authors are required to sign the form to verify authorship.

Clinical Chemistry is copyrighted by the AACC. Permission to reproduce copyrighted material for scholarly use can be arranged through the Managing Editor; that for commercial use, through the Business Office.

Statement of Interest

Authors are expected to disclose any commercial associations that might pose a conflict of interest with the work submitted for publication. To meet this expectation, authors must acknowledge in the manuscript all funding sources supporting the work and all of their institutional or corporate affiliations. Other kinds of associations, such as consultancies, stock ownership or other equity interests, or patent-licensing arrangements, must be disclosed to the Editor in a covering letter at the time of submission. Such information is held in confidence while the paper is under review and does not influence the editorial decision. For accepted manuscripts, the Editor will discuss with the authors how best to disclose the relevant information.

Reference to Unpublished Work

Authors citing papers in press, personal communications, or other unpublished work by individuals not listed as authors on the manuscript submitted to Clinical Chemistry must submit with their manuscript a letter from the individuals concerned confirming the work and giving permission for the citation.

Raw Data

Authors are expected to retain for a minimum of 1 year the raw data from laboratory or clinical studies and to be willing to present these data upon request of the
Editor of *Clinical Chemistry* in the event that the data are contested.

Studies with Human Subjects

If humans have been used as experimental subjects in any part of the study being reported, state in the text whether the procedures followed were in accordance with the ethical standards of your institution's responsible committee or with the Helsinki Declaration of 1975, as revised in 1983.

Use of Laboratory Animals

For studies in which animals have been used, state in the manuscript whether their care was in accordance with the *Guide for the Care and Use of Laboratory Animals* (2) or with your institution's guidelines.

Availability of Materials

Manuscripts are accepted for review with the understanding that unique materials necessary to reproduce the results reported, such as computer software, reagents, cell lines, cloned DNA, and monoclonal antibodies, are available for use by qualified investigators. Questions about this requirement should be addressed to the Editor.

Page Charges

There are no page charges.

Length Restrictions

Space in the journal is limited and authors are expected to present their work concisely.

Figures and tables that duplicate written text or each other are considered unnecessary, as are most figures that show only a linear relation or few data points. Several curves can sometimes be combined in a single figure. Lengthy tabulations are expensive to set; unless essential, they should be replaced by statistical statements.

Special limits apply to Technical Briefs and Letters to the Editor; see *Manuscript Organization* below.

Reprints

Reprints of papers published in *Clinical Chemistry* can be obtained at any time in multiples of 100. Authors of invited Editorials and Reviews receive 100 reprints free of charge.

Release of Information to the Public

An unpublished manuscript is a privileged document. It should not be released to the press or the public prior to publication, nor should it be used for teaching purposes until it has appeared in the journal. Exceptions to this policy, e.g., for matters related to public health, should be discussed in advance with the Editor.

Submission of Manuscripts

Submit four copies of the manuscript (*and three hard copies of any later revision*). Each copy must include all figures and tables. Manuscripts and figures will not be returned to the authors.

Address manuscripts and other editorial correspondence to: Dr. David E. Bruns, Editor, *Clinical Chemistry*. For regular mail: P.O. Box 3757, University Station, Charlottesville, VA 22903-0757. For express delivery: Towers Office Building, Suite 609, 1224 West Main Street, Charlottesville, VA 22903.

Include with your manuscript a covering letter addressed to the Editor stating (a) the title of the paper; (b) the paper's main point; and (c) the name, address, telephone number, and fax number of the author to whom correspondence should be addressed.

Related Papers Submitted to Other Publications

Enclose three copies each of any unpublished manuscripts you have submitted to other journals that may be critical to the evaluation of the paper you are submitting to *Clinical Chemistry*.

Typesetting from Disk

Submit final versions of accepted manuscripts on computer disk together with three hard copies. Both 5.25- and 3.5-in. disks are acceptable. They may be single- or double-sided and single, double, or high density. WordPerfect 5.0 or 5.1 or Microsoft Word 3.0 or 4.0 are the preferred programs, but an ASCII file is also acceptable. Indicate on the disk label the manuscript number, the name of the first author, and the software (including the version) used.

Manuscript Organization

Most manuscripts include the following sections: title, abstract, introduction, materials and methods, results, discussion, and references. Special requirements are as follows:

Reviews. Include headings appropriate to the text.

Case Reports and Case Conferences. Consult recent issues of the journal.

Technical Briefs. These are summaries of findings that may be of interest to a limited audience. Readers requiring fuller details than can be provided in the journal should obtain them from the author or authors of the paper. Technical Briefs must be short: 500-word limit, or three manuscript pages (typed double-spaced), with either one figure or one table. Briefs dealing with "kit" or instrumentation intercomparisons or evaluations, or with adaptations of kit methods to specific analyses, are not generally published in the journal; they may be submitted to the editor of the AACC publication *Clinical Chemistry News*, 2101 L Street, NW, Washington, DC 20037, to be considered for publication there.

Letters to the Editor

These concern any subject relevant to clinical chemists and should be short: 750-word limit (no more than four double-spaced manuscript pages, including the references). Either one figure or one table may be included.

Manuscript Preparation

Use wide (2 cm) margins and double (with typewriter) or triple (with word processor) spacing throughout the
abstract, text, references, tables, figure legends, and footnotes. Write on one side of the paper. Use a separate sheet for the title page. Use another page for the abstract and for Indexing Terms (that are not part of the title). Place references, tables, figure legends, and footnotes on separate pages, in that order. Number every page, starting with the title page, in the top right-hand corner. Insert the last name of the first author in front of each page number.

For guidance on manuscript preparation and style consult The ACS Style Guide: A Manual for Authors and Editors (3) or the CBE Style Manual (4).

Title Page

Provide a short but informative title. Write the authors’ first and last names in full. Use footnotes to indicate the laboratory affiliations of the authors, the authors’ current addresses if these differ from where the work was done, the author for correspondence, and any nonstandard abbreviations used in the text. Also include on the title page the telephone and fax numbers of the corresponding author.

Abstract

Provide an abstract that summarizes, in no more than 150 words, the plan, basic procedures, main results, and principal conclusions of the study. The abstract is the most widely read portion of the paper and is used by indexing and abstracting services. Technical Briefs, Letters to the Editor, and Case Conferences do not require an abstract.

Indexing Terms

Below the abstract provide three to eight words or phrases that will be of assistance to indexers; terms from the Medical Subject Headings (MeSH) list of Index Medicus are recommended.

Introduction

Describe in the introduction the purpose of the study, its importance, and its relation to previous work, and state very briefly your main finding. If you are reporting a method, indicate why your method is preferable to older methods. Provide strictly pertinent references, not an extensive review of the subject.

Materials and Methods

The material to be presented dictates the way in which this section is written.

Apparatus. Identify the apparatus used, providing the name and location (city and two-letter state abbreviation if in the US; city and country if outside the US) of the manufacturer. Provide the model number if multiple versions exist. Add further details only if the equipment is not standard. If standard apparatus has been modified or new apparatus built, describe them in sufficient detail to allow a knowledgeable reader to understand the principle of operation or, preferably, to duplicate the construction.

Reagents. List all reagents used; describe in detail and indicate the source of special or unusual ones. If purity or stability of reagents is critical, indicate the degree of purity and method of preservation. In addition to molar units, it may be desirable to provide mass units for expressing amounts or concentrations of uncommon chemical compounds.

State the pH and composition of buffers, citing standard references where possible. Indicate the temperature at which critical pH measurements are made. Indicate all components in a reaction, whether they are “active” or not, and make clear whether the concentrations in a reaction mixture represent final or original concentrations of the solutions mixed.

Procedures. Provide citations rather than descriptions of published procedures except where a brief summary of the principle of a method or modifications of it is appropriate. Include sufficient details of critical steps (e.g., collection and storage of samples), standardization, calibration, and calculation of results to enable others to understand the work and, preferably, to repeat it. Mention potential hazards as appropriate.

Results

Present the results concisely. Use tables or graphs for clarification as necessary. Do not repeat in the text all the data in the tables and illustrations.

Discussion

Discuss the significance of the results and show how they lead to a valid conclusion. Compare and contrast your results with those of previous studies. Distinguish clearly between speculation and fact.

Acknowledgments

In a brief paragraph preceding the references, acknowledge financial support, gifts, technical help, or other assistance, including that rendered by a company in evaluation of a product; see the Statement of Interest above.

References

Cite references in the text in numerical order, using underlined Arabic numerals in parentheses. Cite only essential references; refer to review articles when appropriate. Include in the text (in parentheses) references to unpublished work, manuscripts in preparation, verbal reports given at meetings, and personal communications. Include in the reference list any citations of papers in press.

In the reference list name all the authors of papers except, if there are more than seven, list the first six and then write "et al." Indicate which references, if any, are an Editorial, Abstract, Letter, Technical Brief, or Review.

Abbreviations for journal names are those used by Chemical Abstracts and Biological Abstracts. Some examples of reference format follow:

Journals

Books and monographs (except serial volumes, which are treated as journals)

Abbreviations
Avoid the use of unnecessary new abbreviations. Define all nonstandard abbreviations in the text the first time they are used and in a single footnote for all abbreviations cited at the point where the first abbreviation is used. The following are considered standard abbreviations and need not be explained: CV, coefficient of variation (relative standard deviation); SD, standard deviation; EDTA, ethylenediamine tetraacetic acid; Tris, tris(hydroxymethyl)methylamine; ELISA, enzyme-linked immunosorbent assay; HPLC, high-performance liquid chromatography; IgA, IgG, and IgM, immunoglobulins A, G, and M, respectively; RIA, radioimmunoassay.

Use the International System of Units (5) consistently in text, figures, and tables. Note that the abbreviation for liter is L; that for mole is mol. The abbreviation for the international unit of enzyme activity is U; IU is for units of peptide hormones and vitamins.

Some other units and terms commonly used in this journal without definition are as follows: For mass: kg, g, mg, μg, ng; for concentration: mol/L, g/L, mg/L, μg/L; for substance concentration: mol/L, mmol/L, μmol/L, nmol/L; for temperature: °C; for time: s, min, h (but days, months, years); for density: kg/L (the term relative density replaces "specific gravity"); absorbance: A; radioactivity: Ci, mCi, μCi.

Text Footnotes
Use footnotes for auxiliary or explanatory material that cannot be incorporated into the text without seriously disrupting the train of thought. Indicate the position of a footnote in the text by a superscript Arabic numeral. Type the text footnotes on a separate page, indicating the number of the page on which each appears.

Figures
Submit four copies of each figure. For halftones, submit glossy prints. For line drawings, submit glossy prints or laser prints on coated (nonabsorbent) laserprinter paper or drawings in black India ink on white drawing paper. Before preparing the final versions of your figures: Reduce them to the size at which you expect them to be published (usually one column (85 mm) or two columns (176 mm) wide) and verify that symbols and lettering, particularly subscripts and superscripts, are legible. The recommended type size after reduction is 8 points (references are set in 8-point type). Lower-case lettering with an initial capital letter is preferred. On the back of each figure indicate the figure number, the name of the first author, and the top of the figure. Cite every figure in the text, in numerical order, using Arabic numerals.

Color Illustrations
For information on the use of color illustrations, consult the Managing Editor.

Figure Captions and Subcaptions
On a separate sheet provide short captions and subcaptions for each figure. Allow double or triple spacing between the lines. If a figure has been published previously, acknowledge the original source and submit written permission from the copyright holder to reproduce the material. Permission is required before publication, irrespective of authorship or publisher, except for documents in the public domain.

Tables and Table Captions
Type each table, with its brief caption, on a separate page. Explanatory footnotes are indicated by superscript lower-case italic letters in alphabetical order, reading across the table. Number tables consecutively with Arabic numerals in order of mention in the text. Give every column a heading with clearly defined units as appropriate.

Description of Analytical Methods and Results
Manuscripts describing the development and evaluation of the performance of methods and instruments should discuss chemical sensitivity and specificity, detection limits, precision, accuracy, recovery, interference, comparability with other analytical methods, and normal range; when appropriate, clinical data should be included. The paper should document the analytical advantages of the new or modified method over existing methods.

Calibration curves and linearity. Data for these studies should be subjected to linear-regression analysis (if a linear response is obtained) and should include the slope, intercept, standard error of estimate (standard deviation about the regression line), and the standard deviations of the slope and intercept. Standard deviations of repeated points may be included. In preparing radioimmunoassay calibration curves, authors may use any objective, statistically valid method, but should specify the method used (see, e.g., 6).

Precision. Studies must include estimates of "within-run" and "total" standard deviations. Each should be determined at low, normal, and above-normal concentrations with use of specimens that are in an appropriate biological matrix. One method of estimating both within-run and total standard deviation is the analysis of variance experiment described in NCCLS EP5 (7), which calls for two replicates per specimen per run and two runs per day for 20 days. This permits separate estimation of between-day and between-run, within-day.
standard deviations, as well as within-run and total standard deviations. Acceptable alternatives that include only one run per day are also discussed in the cited document.

Accuracy. (a) Analytical recovery studies involve analyses after known amounts of analyte are added to the biological fluid on which the determination will be performed. Recovery of added analyte should be calculated. (b) Interference studies should be performed to assess the effects of common interferences, e.g., lipids, hemoglobin, bilirubin, and components of uremic plasma. Exogenous materials such as commonly used or commonly coadministered drugs that might interfere with the determination should also be tested for interferences. (c) Comparison-of-methods studies should compare results by the new or proposed method with those by a reference-quality method or other generally accepted analytical method for which assay performance is documented (8, 9). It is desirable to test 100 to 200 different samples from patients who have been selected to include a wide variety of pathological conditions and a concentration range that includes values (normal and abnormal) likely to be encountered in routine application. Appropriate statistical evaluation of the data typically requires regression analysis with slopes and intercepts (and their standard deviations) and standard errors of estimates. The correlation coefficient has limited utility.

Reference interval (normal range). Depending on the conclusions of the accuracy studies, modification of the existing reference range may be indicated. Description of the reference interval study should include details about sampling; selection of subjects, including their number, age, and sex distribution; the statistical method for summarizing the results (10); and other factors that would influence the values obtained.

Chromatograms. Chromatograms from gas–liquid and liquid chromatography should usually be presented so readers can see the efficiency of the separation and observe the resolution of interfering substances in the matrix.

Enzyme activities. Enzyme activities should be expressed in international units (U). Temperature and other key assay features must be described in the text or by reference to a published method. When first mentioned in the text, enzymes (measured by activity or mass assays) must be numbered (EC no.) in accordance with the recommendations of the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology on the Nomenclature and Classification of Enzymes (11).

Statistics

Describe statistical methods with enough detail to enable a knowledgeable reader with access to the original data to verify the reported results. When possible, quantify findings and present them with appropriate indicators of measurement error or uncertainty (such as confidence intervals). Avoid sole reliance on statistical hypothesis testing, such as the use of $P$ values, which fails to convey important quantitative information. For further guidance, consult reference 1.

Evaluation of diagnostic accuracy. In clinical studies, simple testing of the significance of differences between mean values of patients' groups (e.g., by Student's $t$-test) provides insufficient information to assess diagnostic accuracy. Scatter plots of data, calculations of diagnostic sensitivities and specificities, and use of approaches such as receiver-operating characteristic (ROC) curves (12), cumulative distribution analyses (13), likelihood ratios (14), and discriminant analysis (15) provides information that is appropriate to specific situations. Discussions of predictive values in illustrative settings may be useful additions to assess the potential clinical utility of tests with known accuracy.

AMERICAN ASSOCIATION FOR CLINICAL CHEMISTRY, INC.

AUTHORS' ASSURANCES AND ASSIGNMENT OF COPYRIGHT

Date: ____________________________  Ms. No. ____________________________

To the American Association for Clinical Chemistry, Inc. (Publisher): We are pleased to submit the enclosed Manuscript entitled

In consideration of the Publisher's publishing this Manuscript, the Author(s) assign(s) to the Publisher and its successors all rights, title, and interest in the Manuscript, now or later protected (including by any renewal, extension, or reversion of copyright) by Copyright Laws of the United States and foreign countries. If this Manuscript is not published within twelve months from the date above, this Assignment is void.

Each Author warrants that his/her Manuscript is an original work not published wholly or partly elsewhere, except in abstract form, and except as noted immediately below; that he/she has full power to make this assignment; that he/she has disclosed to Publisher all contributors to the Manuscript and the underlying work; and that the Manuscript contains nothing unlawful, libelous, invading the right of privacy, or infringing a proprietary right. If portions have been previously published, permission has been obtained for publication in Clinical Chemistry, and the Author(s) are submitting a copy of the permission release and copy for credit lines with this Manuscript.

Each Author assumes responsibility for this Manuscript and for disclosing to Publisher before signing this Assignment all possible conflicts of interests regarding this Manuscript (including sources of support, monetary or other, monetary interests in products studied, consultantships, etc.), whether or not the Author regards them to be actual conflicts of interest. Publisher can edit, adapt, or change this Manuscript, in its sole discretion.

The Publisher grants to Authors the royalty-free right to republish the Manuscript in any book of which they are the Author or Editor, provided that any republication includes a clear written notice of Publisher's copyright. All rights assigned to Publisher shall inure to the benefit of all persons, firms, and corporations who acquire from Publisher any right to distribute, transmit, exhibit, or exploit the product of Publisher, and such product may be released under any company or trade name, brand, trademark, or other designation desired by Publisher. This Assignment shall be governed by and construed under the laws of the District of Columbia.

All Authors of this Manuscript have signed this form, which we are sending to the AACC Editorial Office. For U.S. Government employees, the signature represents that this Manuscript was written as part of official duties and the copyright cannot be assigned.
