ON THE COVER Because we do not have direct contact with patients, we sometimes fail to recognize that the clinical laboratory is often the primary source of information for diagnosis of a disease. This month’s cover picture is a reminder that even the smallest of patients benefit from the testing provided by clinical laboratories. In this issue Turgeon and colleagues describe a flow injection tandem mass spectrometry method for the simultaneous determination of amino acids, acylcarnitines, and succinylacetone, a specific marker of tyrosinemia type 1, in dried blood spots. See article by Turgeon et al. on page 657 and editorial by Pass and Morrissey on page 627. Reproduced with permission from the March of Dimes.

Color figures for Reviews sponsored by Department of Laboratory Medicine, Children’s Hospital Boston.

CALL FOR ART

The all-new design of Clinical Chemistry will now feature a different graphic on the cover each issue. Authors with dynamic graphics should indicate interest in their cover letter upon manuscript submission. Readers are also encouraged to submit dynamic graphics via e-mail at clinchemed@clinchem.aacc.org
