ON THE COVER
Self-Portrait (Green) 1997, by William Utermohlen. After learning in 1995 that he had Alzheimer disease, Utermohlen’s response was to try to contribute to our understanding of this disease by creating a series of self-portraits, intentionally chronicling a look into his personal descent into dementia. Within 5 years the detail had all but disappeared from his portraits, with a final image in 2000 revealing just a nose and mouth. After spending his final years in a nursing home, he died from the consequences of Alzheimer disease in 2007. Scientists continue to explore the pathogenesis of this disease and potential new therapies. This issue of Clinical Chemistry contains an informative Q&A feature in which 4 specialists examine the latest advances in the pathogenesis, diagnosis, and therapy for this debilitating disease, including the possibilities of an Alzheimer vaccine.
