**ON THE COVER** Vitamin D is an increasingly important topic in modern healthcare. However, even after years of research, it is not clear what path should be taken regarding vitamin D values in the population. What is the true prevalence of vitamin D deficiency? What should be measured? What 25-hydroxyvitamin D cutoff values should be used to define vitamin D deficiency? Should vitamin D supplementation be promoted in the general population? Does vitamin D have an association with any chronic condition beyond the risk for fractures? In this month's Q&A feature, 4 experts discuss what we still do not know and where we might be headed.
